Introduction to Work, Energy, and Power

Understanding the interplay between work, energy, and power is fundamental in physics. These concepts describe how forces affect motion and how energy is transferred and transformed in physical systems.

What is Work?

Work in physics is defined as the product of force and displacement in the direction of the force. It quantifies the effort exerted to move an object over a distance.

1. **Mathematical Expression:** $W = F \times d \times \cos(\theta)$
2. **Where:**
 1. W = work done (joules, J)
 2. F = magnitude of the force applied (newtons, N)
 3. d = displacement of the object (meters, m)
 4. θ = angle between force and displacement vectors (degrees or radians)
1. If the force is in the same direction as displacement ($\theta=0^\circ$), work is positive.
2. If the force opposes displacement ($\theta=180^\circ$), work is negative.
3. If the force is perpendicular to displacement ($\theta=90^\circ$), no work is done.

What is Energy?

Energy is the capacity to do work. It exists in various forms, including kinetic energy, potential energy, thermal energy, and more.

1. **Kinetic Energy (KE):** Energy possessed by a body due to its motion.
2. **Potential Energy (PE):** Stored energy based on position or configuration.

What is Power?

Power measures the rate at which work is done or energy is transferred or converted over time.

1. **Mathematical Expression:** $P = W / t$
2. **Where:**
 1. P = power (watts, W)
 2. W = work done (joules, J)
 3. t = time taken (seconds, s)

Core Concepts and Formulas

A solid understanding of the formulas and their applications is essential for solving problems related to work, energy, and power.

Work-Energy Theorem

This fundamental principle states that the net work done on an object is equal to its change in kinetic energy.

1. **Mathematically:** $W_{\text{net}} = \Delta KE = KE_{\text{final}} - KE_{\text{initial}}$

Kinetic Energy

The energy of a moving object is given by:

1. **Formula:** $KE = (1/2) m v^2$

2. **Where:**

1. m = mass of the object (kg)
2. v = velocity of the object (m/s)

Potential Energy

Stored energy based on an object's position in a gravitational field:

1. **Formula:** $PE = m g h$

2. **Where:**

1. m = mass (kg)
2. g = acceleration due to gravity (9.8 m/s^2)
3. h = height above reference point (m)

Power Calculations

Power can be calculated in multiple ways, depending on the context:

1. Using work and time: $P = W / t$
2. Using force and velocity for constant power systems: $P = F \times v$
3. In rotational systems: $P = \tau \times \omega$ (where τ is torque and ω is angular velocity)
