1. Variables, Expressions, and Equations

- Variables represent unknown or changeable quantities, typically denoted by letters such as x , y , or z .
- Expressions combine variables, numbers, and operations (addition, subtraction, multiplication, division, exponents) to form mathematical statements, e.g., $3x + 5$.
- Equations are statements asserting the equality of two expressions, e.g., $2x - 4 = 10$. Solving equations involves

finding all values of variables that make the statement true.

2. Functions and Function Notation

- A function is a relation that assigns exactly one output to each input. - Function notation: $f(x)$, $g(x)$, etc., for expressing the output of a function based on input x . - Understanding the concept of domain (all possible inputs) and range (all possible outputs) is central to function analysis.

3. Basic Operations and Properties

- Properties such as associative, commutative, distributive, and identity are essential for manipulating expressions. - Operations include addition, subtraction, multiplication, division, and exponentiation.
