Continuous vs. Discrete Signals: The Basic Distinction

The fundamental difference between continuous and discrete signals lies in their domain and how they are represented.

Continuous Signals

A continuous signal is defined for all values of its independent variable, typically time. These signals are represented as functions that can take on any value within a range, often described mathematically as:

$$x(t) \quad \text{where} \quad t \in \mathbb{R}$$

Examples of continuous signals:

3. Require continuous-time processing hardware (e.g., analog circuits)

Discrete Signals

A discrete signal is defined only at specific, separate points in the domain, typically obtained by sampling a continuous signal at regular intervals. It can be represented as:

$$x[n] = x(nT) \quad \text{where} \quad n \in \mathbb{Z}$$
