Common Questions Addressed by the Phet Gas Properties Simulation Answer Key

Below are typical questions and scenarios covered by the answer key, along with explanations:

1. How does decreasing the volume of a gas at constant temperature affect pressure?

Answer: According to Boyle's Law, pressure and volume are inversely proportional at constant temperature. When the volume decreases, the pressure increases proportionally. The answer key confirms this relationship by showing that halving the volume doubles the pressure, assuming temperature and number of particles remain constant.

2. What happens to the pressure when the temperature of a fixed amount of gas is increased at constant volume?

Answer: Gay-Lussac's Law states that pressure and temperature are directly proportional when volume and moles are fixed. The answer key illustrates that increasing temperature results in a proportional increase in pressure.

3. How does adding more gas particles at constant temperature and volume affect pressure?

Answer: Increasing the number of particles increases the frequency of collisions with the container walls, thus raising pressure. The answer key shows a linear relationship between the number of particles and pressure under these conditions.

4. How are the combined gas laws represented in the simulation?

Answer: The simulation demonstrates the combined gas law, which combines Boyle's, Charles's, and Gay-Lussac's laws. The answer key provides step-by-step calculations showcasing how changing multiple variables simultaneously affects the gas state.
