Introduction to Modified Release Drug Delivery Technology

Modified release (MR) drug delivery systems encompass a broad range of formulations engineered to release drugs at predetermined rates, times, and locations. Unlike immediate-release formulations that deliver the drug promptly upon administration, MR systems can sustain drug levels within therapeutic windows over extended periods, reduce dosing frequency, and minimize side effects caused by peak-trough fluctuations.

This technology has been applied to various routes of administration, including oral, topical, transdermal, and injectable forms. Among these, oral modified release formulations are the most prevalent, owing to their convenience and patient acceptance. The development of MR systems relies on sophisticated formulation techniques, excipients, and delivery devices designed to achieve specific release profiles tailored to the pharmacokinetics and pharmacodynamics of individual drugs.

Types of Modified Release Systems

Modified release systems can be broadly categorized based on their mechanism of action and release profile:

1. Sustained Release (SR)

Designed to release the drug slowly over an extended period, maintaining plasma concentrations within the therapeutic window.

1. Controlled Release (CR)

Aim to release the drug at a controlled rate, often matching a mathematical zero-order kinetics, regardless of drug concentration.

1. Extended Release (ER)

Similar to sustained release but typically used for formulations intended to release the drug over longer durations, such as 12-24 hours.

1. Delayed Release (DR)

Intended to release the drug after a specific lag time, often to prevent degradation in the stomach or target specific intestinal regions.

1. Targeted Release

Designed to deliver the drug specifically to a particular site within the body, such as the colon, intestine, or specific tissues.
