Introduction to Fractures

Definition and Overview

A fracture is a break in the continuity of a bone resulting from trauma, pathological processes, or stress. It can range from hairline cracks to complete displacements. Fractures are classified based on various criteria, including their morphology, location, etiology, and stability.

Etiology and Risk Factors

Understanding the causes of fractures assists in prevention and management:

1. Traumatic injuries (e.g., falls, road traffic accidents)
2. Pathological fractures due to osteoporosis, tumors, or infection
3. Stress fractures from repetitive overuse
4. Bone fragility syndromes

Classification of Fractures

Based on Morphology

- Transverse - Oblique - Spiral - Comminuted - Segmental - Greenstick - Torus (buckle)

Based on Displacement and Stability

- Stable fractures - Unstable fractures - Displaced fractures - Non-displaced fractures

Based on Etiology

- Traumatic - Pathological - Stress

Specific Fracture Types

- Open (compound) fractures - Closed (simple) fractures - Fatigue fractures

Clinical Presentation and Diagnosis

History and Symptoms

Patients often present with:

1. Pain localized at the injury site
