Algebra: Expressions, Equations, and Polynomials

Understanding Algebraic Expressions

Algebra forms the foundation of many mathematical concepts. An algebraic expression combines variables, constants, and mathematical operations. For example, $3x + 5$ is an algebraic expression where $3x$ is a term involving the variable x , and 5 is a constant. Key components in algebraic expressions: - Variables: Symbols representing unknown quantities (e.g., x , y). - Constants: Fixed numerical values (e.g., 2 , -7). - Coefficients: Numerical factors multiplying variables (e.g., 3 in $3x$). - Terms: Parts of an expression separated by addition or subtraction. Solution approach: When simplifying algebraic expressions, the goal is to combine like terms, which are terms with the same variable raised to the same power. For example, simplifying $2x + 3x - 4 + 7$ involves combining $2x$ and $3x$ to get $5x$, and $-4 + 7$ to get 3 , resulting in $5x + 3$.

Solving Linear Equations in Two Variables

Linear equations in two variables, such as $ax + by + c = 0$, are fundamental in modeling real-world situations. The solutions are pairs (x, y) that satisfy the equation. Methods for solving: - Graphical Method: Plotting the equations on a coordinate plane and identifying the point(s) of intersection. - Substitution Method: Expressing one variable in terms of the other and substituting into the second equation. - Elimination Method: Adding or subtracting equations to eliminate a variable, facilitating the solution. Analytical solution example: Solve the system: 1. $2x + 3y = 12$ 2. $x - y = 3$ Solution: From equation (2): $x = y + 3$ Substitute into (1): $2(y + 3) + 3y = 12$
 $\Rightarrow 2y + 6 + 3y = 12 \Rightarrow 5y + 6 = 12 \Rightarrow 5y = 6 \Rightarrow y = 6/5 = 1.2$ Now, $x = y + 3 = 1.2 + 3 = 4.2$ The solution is $(4.2, 1.2)$.

Polynomials: Classification and Operations

Polynomials are algebraic expressions involving variables raised to whole-number exponents. They are classified based on degree: - Linear polynomial: Degree 1 (e.g., $3x + 2$) - Quadratic polynomial: Degree 2 (e.g., $x^2 + 5x + 6$) - Cubic polynomial: Degree 3, and so on. Operations include: - Addition and subtraction: Combining like terms. - Multiplication: Using distributive property. - Division: Polynomial division, often using long division or synthetic division. Solution tip: Factoring polynomials simplifies solving equations like

$x^2 + 5x + 6 = 0$. Factoring yields $(x + 2)(x + 3) = 0$, giving solutions $x = -2$ and $x = -3$.

Coordinate Geometry: Plotting and Analyzing Graphs

Plotting Points and Graphs

Coordinate geometry introduces the Cartesian plane, where points are represented by ordered pairs (x, y) . Plotting involves marking points based on their x and y coordinates. Key concepts: - X-axis and Y-axis: Perpendicular axes intersecting at the origin. - Quadrants: Four regions divided by axes. - Distance formula: $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$ - Midpoint formula: $M = ((x_1 + x_2)/2, (y_1 + y_2)/2)$ Application: Plotting the points $(2, 3)$ and $(5, 7)$, the distance is $\sqrt{(5-2)^2 + (7-3)^2} = \sqrt{9 + 16} = \sqrt{25} = 5$ units.

Equations of Lines

The equation $y = mx + c$ represents a straight line, where m is the slope, and c is the y -intercept. Understanding slope: The slope (m) indicates the steepness and direction. Calculated as $m = (y_2 - y_1)/(x_2 - x_1)$. Solution approach: Given two points, (x_1, y_1) and (x_2, y_2) , find the slope. Then, write the equation of the line using point-slope form or slope-intercept form.

Congruence of Triangles

Two triangles are congruent if they are identical in shape and size. Criteria include: - SSS (Side-Side-Side): All three sides equal. - SAS (Side-Angle-Side): Two sides and the included angle are equal. - ASA (Angle-Side-Angle): Two angles and the included side are equal. - RHS (Right angle-Hypotenuse-Side): For right triangles.
