Fundamental Principles of Organic Chemistry

Organic chemistry revolves around several core concepts:

1. **Carbon's Versatility:** Carbon atoms can form four covalent bonds, creating a diverse array of structures including chains, rings, and complex frameworks.
2. **Functional Groups:** Specific groups of atoms like hydroxyl (-OH), carbonyl ($>\text{C}=\text{O}$), amino ($-\text{NH}_2$), and carboxyl ($-\text{COOH}$) dictate the properties and reactivity of organic molecules.
3. **Isomerism:** Molecules with the same molecular formula but different structures (structural isomers) or spatial arrangements (stereoisomers) influence biological activity.

Major Classes of Organic Compounds in Biology

Biochemistry primarily deals with the following classes:

1. **Carbohydrates:** Sugars and polysaccharides involved in energy storage and structural support.
2. **Lipids:** Fats, oils, and phospholipids crucial for cell membranes and energy reserves.
