- How does the skin and other tissues perceive touch, pressure, and temperature?

By studying the answer key, students can better grasp the detailed functions of each sensory organ and understand the physiological mechanisms underlying perception.

Anatomy of the Visual System

The Structure of the Eye

The eye, as the primary organ of vision, contains several specialized structures:

1. **Cornea:** The transparent front part of the eye that refracts light.
2. **Anterior chamber:** Fluid-filled space between the cornea and iris.
3. **Pupil:** The adjustable opening that regulates light entry.
4. **Iris:** The colored muscle controlling pupil size.
5. **Lens:** Focuses light onto the retina.
6. **Retina:** The light-sensitive layer containing photoreceptor cells.
7. **Optic nerve:** Transmits visual information to the brain.

Physiology of Vision

The process of vision involves multiple steps:

1. Light enters the eye through the cornea and passes through the pupil.
2. The lens adjusts shape to focus light on the retina.
3. Photoreceptor cells in the retina (rods and cones) detect light stimuli.

4. Signals are processed by bipolar and ganglion cells within the retina.
5. The optic nerve transmits visual signals to the visual cortex in the brain.

Key Concepts from the Answer Key The answer key clarifies common questions such as: - The differences between rods and cones. - How visual acuity is affected by the shape of the eye. - The role of the optic chiasm in visual processing. Anatomy of the Auditory System Components of the Ear The ear is divided into three main parts:

1. **Outer ear:** Comprises the pinna and external auditory canal, capturing sound waves.
2. **Middle ear:** Contains the ossicles (malleus, incus, stapes) that amplify sound.
3. **Inner ear:** Contains the cochlea and vestibular apparatus responsible for hearing and balance.

Physiology of Hearing The process involves:

1. Sound waves cause the eardrum to vibrate.
2. Vibrations are transferred via ossicles to the oval window of the cochlea.
3. The fluid inside the cochlea moves, stimulating hair cells.
4. Hair cells convert mechanical movement into electrical signals.
5. Signals are sent via the auditory nerve to the auditory cortex in the brain.
