

Distributive Property And Combining Like Terms Worksheet

Distributive property and combining like terms worksheet is an essential resource for students and educators aiming to strengthen foundational algebra skills. These worksheets are designed to enhance understanding of two fundamental concepts in algebra: the distributive property and the process of combining like terms. Mastering these topics is crucial for solving algebraic expressions efficiently and accurately, paving the way for success in advanced mathematics.

Understanding the Distributive Property

What is the Distributive Property?

The distributive property is a key algebraic principle that illustrates how to multiply a single term across terms within parentheses. It states that: $a(b + c) = ab + ac$ This property allows students to eliminate parentheses by distributing the multiplication over addition or subtraction, simplifying complex expressions.

Why is the Distributive Property Important?

- Simplifies complex expressions: Enables breaking down expressions into manageable parts.
- Foundational in algebra: Essential for understanding equations, factoring, and solving for variables.
- Prepares for advanced topics: Crucial for polynomial multiplication, expanding expressions, and algebraic proofs.

Examples of Using the Distributive Property

- Example 1: $3(4 + 5) = 3 \times 4 + 3 \times 5 = 12 + 15 = 27$ - Example 2: $-2(x - 7) = -2 \times x + (-2) \times (-7) = -2x + 14$

Combining Like Terms

What Are Like Terms?

Like terms are terms that contain the same variables raised to the same powers. Constants (numbers without variables) are also considered like terms with each other.

Why Combine Like Terms?

- Simplify expressions: Reduces the complexity of algebraic expressions.
- Facilitates solving equations: Makes it easier to isolate variables.
- Prepares for graphing: Simplifies the expression of linear and

polynomial functions.

Examples of Combining Like Terms

- Example 1: $(4x + 3x = 7x)$ - Example 2: $(5y - 2y + 3 = 3y + 3)$ - Example 3: $(6a + 4b - 2a + b = (6a - 2a) + (4b + b) = 4a + 5b)$
