Design Examples and Practical Applications

Let's consider a practical example: designing a simply supported beam subjected to a uniformly distributed load. Example Parameters: - Span (L): 6 meters - Load (w): 10 kN/m - Concrete grade: M20 - Steel grade: Fe415 Design Steps: 1. Calculate total load: - Self-weight + live load 2. Determine bending moment: - $M_u = \frac{wL^2}{8}$ 3. Assume effective depth (d), typically 0.9 times the overall depth minus cover. 4. Calculate the required area of steel (A_{st}): - Using bending equation $M_u = 0.138 f_{ck} b d^2$ (approximate) 5. Select bar sizes and spacing. 6. Check shear capacity and provide stirrups if necessary. 7. Finalize reinforcement detailing. This systematic approach aligns with BC Punmia's methodology, emphasizing clarity, safety, and efficiency.
